

FIELD EXPERIENCE WITH PROFUME® GAS FUMIGANT

Jay Coleman, Research Fumigation Company, LLC

ProFume® gas fumigant (sulfuryl fluoride 99.8%) is registered in the U.S for cereal a multitude of post-harvest fumigation applications. Research Fumigation Company (RFC) has been a partner in the development and launch of ProFume. In addition, RFC has successfully completed required stewardship and product training provided by Dow AgroSciences (DAS). RFC has been commercially fumigating structures with ProFume since market inception. This presentation covers some of the positive field observations, and the practicality of using sulfuryl fluoride (SF). ProFume is couched in a science-based label, and practically applied, removes the guess work from fumigation practices. This improved standard is achieved through the Fumiguide™ program for ProFume gas fumigant. In our observations, ProFume fumigations achieved a very high level of insect control and customer satisfaction.
